

# BCCS-US Runtime Governance

## Live Demo Run-Book — 12 Demos in 5 Steps

AIEOS GATE Engine · Prepared July 13, 2026 · Approx. run time: 15–20 minutes

This guide walks through all 12 governance demos in the order that flows best on stage. Each stop is one page of the app; demos are grouped so you never backtrack. Follow the checklist below first — both items caused confusion in earlier testing.

### Before You Start (required)

---

#### 1. Use the development preview — not the published app

The published version was deployed before these features were built, so the Governance tab and impact analysis do not exist there. Run the demo from the workspace preview URL, or republish first so the live app matches.

#### 2. Log in as a Customer Admin — not a SuperAdmin

SuperAdmin accounts (@bccsworld.com) see only the License tab in the Admin Dashboard, so Demos 5, 10, and 12 will be invisible. Use a Customer Admin account. Ready-made test account:

Email: e2etest@bccs.us  
Password: TestPass123!

#### 3. Optional: reset to clean demo data

To start from a clean, seeded state (policies, sample decisions, escalations, activity feed): log in, press F12 to open the browser console, paste this, and press Enter:

```
fetch('/api/governance/demo-reset', { method: 'POST' })  
  .then(r => r.json()).then(console.log)
```

### Stop 1 — /ai-audit-compliance (Demos 1 & 9)

---

#### Demo 1 — Ask Before You Act

1. Find the "Ask Before You Act" card.
2. Type a question such as: "Can I delete a signed training record?"
3. Set the authority dropdown to Instructor and submit.

**Expected:** A decision card appears — Refused or Escalated — with plain-English reasoning and the regulation it rests on (e.g., 14 CFR 142.45). Asking as an Instructor about an action above their authority also creates a pending approval, which you will resolve in Demo 5.

4. Re-ask the same question as FAA Designated Examiner.

**Expected:** Still refused. Protected actions cannot be bypassed even at the highest authority.

*What to say: "Authority rank does not override protected records. The system rules on admissibility before anything executes."*

## Demo 9 — Enterprise Memory

1. On the same page, find the memory card and click "Recall Precedent."

**Expected:** A list of prior decisions for that action type — who asked, what was decided, and why.

*What to say: "Every ruling is remembered. The system cites its own precedent, like case law."*

## Stop 2 — /dashboard (Demos 2 & 8)

---

### Demo 2 — Continuous governance summary

1. Point out the summary cards at the top: live totals of admitted, refused, and escalated actions.

### Demo 8 — Shared awareness feed

1. Point out the activity feed listing governance events as they happen.
2. Leave this page open in a second browser tab — after Demo 7 you will return here to show new entries arriving.

## Stop 3 — /compliance-records (Demos 3, 4, 6 & 11)

---

### Demos 4 & 6 — Runtime refusal on a protected record

1. Find a record marked Signed (green shield icon).
2. Click Delete on it. In the dialog, choose any authority — even the highest.

**Expected:** Deletion is refused. A GATE decision card explains the record is in a protected state under the cited regulation, and that a versioned append is the auditable alternative. Nothing is removed.

3. Optional contrast: delete an unsigned record as a low authority.

**Expected:** Instead of executing, the request is escalated into the human approval queue.

*What to say: "The delete request went through the governance engine at runtime. It was ruled inadmissible — not blocked by a UI permission, but refused with cited regulatory grounds."*

### Demos 3 & 11 — Evidence Package / complete audit trail

1. Click the "Evidence Package" button (top right).

**Expected:** A dialog assembles the signed records with key fingerprints and verification status — a complete, cryptographically verifiable package.

2. Also click Verify on any signed row to validate one record's signature live.

*What to say: "When the auditor arrives, evidence is assembled on demand — every record signed, every signature verifiable."*

## Stop 4 — /faa-repository (Demos 7 & 8)

---

### Demo 7 — Regulation Update Impact

1. Scroll to any 14 CFR Part card and click "Analyze Compliance Impact." The page scrolls up to the "Regulation Impact Analysis" card.

**Expected:** Counts of affected policies, protected controls, prior decisions, and signed records — plus an AI-written summary and recommended actions.

2. Run the same Part again within ~10 minutes.

**Expected:** The analysis still shows, but it does not re-broadcast to the activity feed (debounced to avoid spam).

3. Switch to your /dashboard tab.

**Expected:** New feed entries from the impact analysis have appeared — this is the Demo 8 payoff.

*What to say: "A regulation changed. The platform immediately maps which policies, prior decisions, and signed records are touched — and broadcasts it across the organization."*

## Stop 5 — /admin-dashboard > Governance tab (Demos 5, 10 & 12)

This tab only appears for Customer Admin accounts. If you do not see it, you are logged in as a SuperAdmin — switch accounts (see "Before You Start").

### Demo 10 — APEX Enterprise Visibility

1. Show the executive rollup at the top of the tab: totals, pending approvals, protected controls.

### Demo 5 — Escalation queue (human decision)

1. In Pending Approvals, find the escalation created in Stop 1 (or Stop 3).

2. Approve or Reject it, adding a note.

**Expected:** It moves to resolved history, the audit trail records who decided, and the summary counts update.

*What to say: "Humans stay sovereign. The engine refuses or escalates — people make the judgment calls, and every judgment is recorded."*

### Demo 12 — Complete Operational Story

1. Click "Run the Complete Operational Story."

**Expected:** A guided four-step walkthrough plays the full arc end-to-end: ask, refuse, escalate, human decision. Use this as your closing beat.

## How to Position It (one honest paragraph)

Present the activity feed as a live governance activity log — not as autonomous AI agents. Decisions come from the deterministic GATE rules engine (authority hierarchy + policy rules, every ruling persisted and auditable). AI (GPT-4o) is used in two places: mapping free-text questions to the right policy, and writing impact/precedent summaries. That framing is accurate, defensible under technical questioning, and still lands the core message: actions are proven admissible before they execute.
